

Survey Field Injection Protocol

Integrating REDCap & Qualtrics with the My Health Passport Portal

Executive Summary: The My Health Passport Portal provides a secure landing page for participants to generate or enter their **My Health Passport Number (SLK-581)** prior to starting a research study. Upon giving permission, the portal automatically injects this pseudo-anonymized key into your REDCap or Qualtrics survey as a URL parameter (`?slk=...`), enabling robust participant linkage without collecting first or last names.

1. Portal Workflow Overview

- Participant Landing:** Participant opens your custom My Health Passport Portal link.
- Identity Key Generation:** Participant inputs or generates their SLK-581 code.
- Consent to Share:** Participant clicks *"Share your My Health Passport Number with [Your Survey Title]"*.
- Field Injection & Redirect:** The portal opens your survey in a new tab, passing the SLK-581 code into the survey dataset.

2. Constructing Your Bespoke Portal Link

To route participants through the portal to your survey, format your distribution URL using two required query parameters:

```
https://portal.myhealthpassport.org.au/?siteTitle=[YOUR_SURVEY_NAME]&siteUrl=[YOUR_SURVEY_URL]
```

- `siteTitle` : The title of your study (e.g., `ED Injury Study`).
⚠ *Note: Survey titles cannot contain plain spaces in the URL string. Spaces must be encoded as `%20` .*
- `siteUrl` : The direct public link to your REDCap or Qualtrics survey.

1. Copy Base
Survey URL

2. Encode Title &
URL

3. Generate Portal
Link

4. Create QR /
Short Link

Recommended Tools: Use our Online URL Encoder at portal.myhealthpassport.org.au/encoder to build your link automatically. Once generated, convert your long link into a **QR Code** (for flyers/posters) or run it through a **URL Shortener** (for SMS/emails).

Link Examples

Example 1: Standard REDCap Survey

Title: ED Injury Study | **Target:** <https://redcap.rmh.org.au/surveys/?s=8X9Y7Z>

Portal Link: <https://portal.myhealthpassport.org.au/?siteTitle=ED%20Injury%20Study&siteUrl=https://redcap.rmh.org.au/surveys/?s=8X9Y7Z>

Example 2: Multi-Word Qualtrics Title

Title: Cardiovascular Health Study 2026 | **Target:** https://melbourne.qualtrics.com/jfe/form/SV_9AB123

Portal Link: https://portal.myhealthpassport.org.au/?siteTitle=Cardiovascular%20Health%20Study%202026&siteUrl=https://melbourne.qualtrics.com/jfe/form/SV_9AB123

3. Survey Platform Setup

CRITICAL REQUIREMENT FOR MULTI-PAGE SURVEYS:

The target `slk` field **MUST be located on the very first page** (Section 1) of your survey. If the field is placed on Page 2 or later, page navigation will strip the incoming URL parameter before it can be captured.

Option A: REDCap Setup

1. Open your project in REDCap and go to the **Online Designer**.
2. On the **first survey instrument/page**, add a new Text Box field.
3. Set the **Field Name** to exactly `slk`.
4. Under **Action Tags / Field Annotation**, add `@READONLY` to prevent participant editing.

Option B: Qualtrics Setup

1. Open your survey in Qualtrics and navigate to the **Survey Flow** tab.
2. Click **Add a New Element Here** and select **Embedded Data**.
3. Name the field exactly `slk` (leave value blank).
4. Drag the **Embedded Data** block to the **very top** of your Survey Flow (above Question Block 1).

4. SHA-256 Encrypted Barcode Mode (Optional)

For studies that prefer an extra layer of protection beyond the SLK-581 itself, the portal can optionally transform the participant's Passport Number into a one-way **SHA-256 cryptographic hash** — referred to on the portal as the participant's **My Health Passport Barcode** — before it is ever transmitted to your survey. The hash is a fixed 64-character hexadecimal string that is deterministic (the same SLK-581 always produces the same barcode) but cannot be reversed to recover the original Passport Number or the demographic details behind it.

1. SLK-581 Generated

2. SHA-256 Hashed Locally

3. Barcode Injected into Survey

Enabling Barcode Mode

Add a third query parameter, `barcode=True`, to your portal link. When present, the portal generates the SHA-256 hash automatically and, on consent, injects it into your survey using a `?barcode=...` parameter **instead of** `?slk=...`. The raw SLK-581 is never included in the redirect URL when this mode is enabled — only the hashed barcode value is sent.

```
https://portal.myhealthpassport.org.au/?siteTitle=[YOUR_SURVEY_NAME]&siteUrl=[YOUR_SURVEY_URL]&barcode=True
```

Example: REDCap Survey with Barcode Mode Enabled

Title: ED Injury Study | **Target:** `https://redcap.rmh.org.au/surveys/?s=8X9Y7Z`

Portal Link: `https://portal.myhealthpassport.org.au/?siteTitle=ED%20Injury%20Study&siteUrl=https://redcap.rmh.org.au/surveys/?s=8X9Y7Z&barcode=True`

When barcode mode is active, the portal's consent button and disclaimer text update automatically to reflect that an encrypted barcode — not the raw Passport Number — is being shared, so participants are always accurately informed about what they're sending.

FIELD NAME DIFFERS FROM STANDARD MODE:

When `barcode=True` is used, your survey's receiving field must be named `barcode`, not `slk`. The two modes are mutually exclusive per link — a given portal link will inject either `?slk=` or `?barcode=`, never both — so only build and label the field that matches the mode your distribution link actually uses. The same first-page/top-of-flow placement requirement described in Section 3 still applies.

Option A: REDCap Setup (Barcode Mode)

1. Open your project in REDCap and go to the **Online Designer**.
2. On the **first survey instrument/page**, add a new Text Box field.
3. Set the **Field Name** to exactly `barcode`.
4. Under **Action Tags / Field Annotation**, add `@READONLY` to prevent participant editing.

Option B: Qualtrics Setup (Barcode Mode)

1. Open your survey in Qualtrics and navigate to the **Survey Flow** tab.
2. Click **Add a New Element Here** and select **Embedded Data**.
3. Name the field exactly `barcode` (leave value blank).
4. Drag the **Embedded Data** block to the **very top** of your Survey Flow (above Question Block 1).

5. HREC Ethics Statement Template

Researchers may adapt the following text for Human Research Ethics Committee (HREC) submissions:

"Data collection will utilize the My Health Passport Portal as a secure participant landing page. Participants will generate/provide their Statistical Linkage Key (SLK-581) on the portal. Upon explicit participant authorization, only the pseudo-anonymized SLK-581 code — or, where the study elects to

use the portal's optional SHA-256 barcode mode, a one-way cryptographic hash derived from it — will be transmitted into the research database via URL parameter injection. No identifying first or last names are captured or transmitted during this process."

Your health research identity. **Your choice.**
